Fourier Series

» Structure and Topology of $\mathbb{T}$

* Defining $\mathbb{T}$ as the set of equivalence class of the relation $x \sim y \iff x - y \in \mathbb{Z}$ and identifying classes in $\mathbb{T}$ with their representative element in $[0, 1)$ as $[x] \to \{x\}$, where $\{x\}$ is the fractional part of x.
* Endow $\mathbb{T}$ with quotient topology by the map $f : \mathbb{R} \to \mathbb{T} := x \to [x]$
* Lebesgue measure on $\mathbb{T}$ is defined by the Lebesgue measure of its identification in $[0, 1)$.

» Functions in $\mathbb{T}$

* Functions in $\mathbb{T}$ are identified with periodic functions in $\mathbb{R}$ with period 1 this again can be completely characterized by their values in $[0,1)$.
* By the quotient topology in $\mathbb{T}$, we see that continuous functions in $\mathbb{T}$ can identified with continuous functions in $\mathbb{R}$ with period 1.
* Also by the Lebesgue measure defined on $\mathbb{T}$, we say $f \in L^p(\mathbb{T})$ if the corresponding function in $[0,1)$ is in $L^p[0,1)$.
* For any two function $f, g \in L^1(\mathbb{T})$, their convolution, $(f * g)(x)$ as

$$(f * g)(x) = \int_0^1 f(x-y)g(y)\ dy$$

is again in $L^1(\mathbb{T})$

» Fourier Coefficients

* For $f \in L^1(\mathbb{T})$, and $n \in \mathbb{Z}$ we define the n^{th} Fourier coefficient of f as

$$\hat{f}(n) = \int_0^1 f(x) e^{-2\pi i n x}\, dx$$

* Also the Fourier series of $f \in L^1(\mathbb{T})$ is defined as

$$\sum_{n=-\infty}^{\infty} \hat{f}(n) e^{2\pi i n x}$$

* Since we are interested in the convergence of the Fourier series, we will define the symmetric and Cesàro partial sums of the Fourier seres respectively as

$$S_N(x) = \sum_{n=-N}^{N} \hat{f}(n) e^{2\pi i n x} \quad \text{and} \quad \sigma_N(x) = \frac{1}{N} \sum_{n=0}^{N-1} S_n(x)$$

» Summability Kernel

* A collection of functions $K_N \in L^1(\mathbb{T})$ are called a summability kernel if it satisfies the following properites
  1. $\int_0^1 K_N(x)dx = 1$
  2. $\int_0^1 |K_N(x)|dx \leq C$ for some constant $C > 0$
  3. $\lim_{N\to\infty} \int_\delta^{1-\delta} |K_N(x)|dx = 0$
* We prove that if K_N is a summability kernel in $L^1(T)$, then $(f * K_N)(x)$ converge to $f(x)$ in $L^1(\mathbb{T})$. That is

$$\int_0^1 |f(x) - (f * K_N)(x)| \; dx$$

» Fejér Kernel and Cesàro Convergence

* Fejér kernel defined as

$$\Delta_N(x) = \sum_{n=-N}^{N} \left(1 - \frac{|n|}{N}\right) e^{2\pi inx}$$

is a summability kernel we get that $(f * \Delta_N)$ converge to f in $L^1(\mathbb{T})$

* Moreover we see that $(f * \Delta_N)(x) = \sigma_N(x)$ and therefore the Cesàro partial sums of the Fourier series of f converge to f in $L^1(\mathbb{T})$.

» Fourier Series in $L^2(\mathbb{T})$

* Since $\mathbb{T}$ is identified with the finite measure space $[0, 1)$, we get that $L^2(\mathbb{T}) \subset L^1(\mathbb{T})$. Theorefore the Fourier coefficients and series can be defined the same way as in $L^1(\mathbb{T})$.
* Moreover we see that if $f \in L^2(\mathbb{R})$, since the Fejér kernel, $\Delta_N \in L^\infty(\mathbb{T})$, its Cesàro partial sum, $\sigma_N = (f * \Delta_N) \in L^2(\mathbb{T})$
* As in $L^1(\mathbb{T})$, we get that the Cesàro partial sums σ_N converge to f in $L^2(\mathbb{T})$. That is

$$\lim_{N\to\infty} \int_0^1 |f(x) - \sigma_N(x)| \ dx = 0$$

* The same results follow for functions in $L^p(\mathbb{T})$

» Fejér Theorem and Pointwise Convergence

Write if needed

Fourier Transforms in $\mathbb{R}$

» Fourier transforms in $L^1(\mathbb{R})$

- For any $f \in L^1(\mathbb{R})$, the Fourier transform of f is defined as

$$\hat{f}(t) = \int_{-\infty}^{\infty} f(x) e^{-2\pi i t x}\, dx$$

- $\hat{f}$ is uniformly continuous and

$$\lim_{|t| \to \infty} \hat{f}(t) = 0$$

» Riemann Lebesgue Lemma

» Fourier Inversion

* Let $f \in L^1(\mathbb{R})$, then the inverse Fourier transform is defined as

$$\check{f}(t) = \int_{-\infty}^{\infty} f(x) e^{2\pi i t x}\, dx$$

* We see that if $f \in L^1(\mathbb{R})$, continuous at $x \in \mathbb{R}$ and its Fourier transform $\hat{f} \in L^1(\mathbb{R})$, then

$$\check{\hat{f}}(x) = f(x)$$

* Generalizing further we get that that if $f, \hat{f} \in L^1(\mathbb{R})$ then

$$\check{\hat{f}} \overset{a.e}{=} f$$

» Fourier transforms in $L^2(\mathbb{R})$

* We consider the space $L^1(\mathbb{R}) \cap L^2(\mathbb{R})$. Since it is a subspace of $L^1(\mathbb{R})$, the definition of Fourier transform and inverse transform holds good in the smaller space.
* (Plancherel's Theorem) If $f \in L^1(\mathbb{R}) \cap L^2(\mathbb{R})$, then

$$\int_{\mathbb{R}} |f(x)|^2 \, dx = \int_{\mathbb{R}} |\hat{f}(t)|^2 \, dt$$

* Now since the collection of compactly supported functions in $\mathbb{R}$, $C_c(\mathbb{R})$ is dense in $L^p(\mathbb{R})$ for all $1 \leq p < \infty$, we get that $L^1(\mathbb{R}) \cap L^2(\mathbb{R})$ is dense in $L^2(\mathbb{R})$.
* Moreover we see that the Fourier transform of functions in $L^1(\mathbb{R}) \cap L^2(\mathbb{R})$ form a dense subset in $L^2(\mathbb{R})$. Therefore we can extend the domain of Fourier transform to $L^2(\mathbb{R})$ and Plancherel's theorem assers that Fourier transform in $L^2(\mathbb{R})$ is an isometry.
